

Subtract across a multiple of 10

Here is an example of how we have been solving subtractions.

This method is useful for developing mental strategies.

$$35 - 6 = \underline{\quad}$$

5 1

$$35 - 5 - 1 = 29$$

First we subtract the number of ones we have to reach a multiple of 10.

$$35 - 5 = 30$$

6 is made of 5 and 1. So we need to subtract 1 more.

$$30 - 1 = 29$$

Use this method to complete the following calculations.

Remember to label the jumps and the number line.

Use the 10 frames set document to help you if you need to.

$$25 - 7 = \underline{\quad}$$

$$25 - \underline{\quad} - \underline{\quad} = \underline{\quad}$$

$$32 - 5 = \underline{\quad}$$

$$32 - \underline{\quad} - \underline{\quad} = \underline{\quad}$$

$46 - 8 = \underline{\quad}$

$46 - \underline{\quad} - \underline{\quad} = \underline{\quad}$

$51 - 6 = \underline{\quad}$

$51 - \underline{\quad} - \underline{\quad} = \underline{\quad}$

$63 - 8 = \underline{\quad}$

$63 - \underline{\quad} - \underline{\quad} = \underline{\quad}$

$57 - 9 = \underline{\quad}$

$57 - \underline{\quad} - \underline{\quad} = \underline{\quad}$

$74 - 9 = \underline{\quad}$

$74 - \underline{\quad} - \underline{\quad} = \underline{\quad}$

$85 - 7 = \underline{\quad}$

$85 - \underline{\quad} - \underline{\quad} = \underline{\quad}$

$94 - 8 = \underline{\quad}$

$94 - \underline{\quad} - \underline{\quad} = \underline{\quad}$

How confident do you feel using this method?
